

ACHESON

Refractory cost—for roofs and side walls—is one of the largest items of expense in electric furnace operation.

Any increase in the life of refractories means a reduction in the cost of producing metal.

The use of Acheson Electrodes lengthens side wall life and also makes possible more tons per roof. Not only is the expense for refractories reduced but there is also a saving in the labor building new roofs and laying up side walls, particularly at the back of the furnace.
